LAND IS MORE

COMPETITION

The domestic architecture, evolved from Pre-Urban House, ranging from the simplest transient huts of nomadic food-gathering/hunting societies, to the permanent homesteads of sedentary societies with agricultural economy. Then the Oriental Urban House that contains inward looking house forms of the four urban civilizations of Mesopotamia, Egypt, the Indus Valley and China. Later, Occidental Urban House outlines the development of urban houses from the dark ages to the end of the twentieth century.

Architecture had humble beginnings: always sheltered a man or even better, a group of men. A sense of society was there, society begins within and from domestic architecture too. But eventually, it has lost its social statements and growing individuality in complete chaos. First question raised for this proposal has been rooted from this observation. What is a home? How should it react with its next door neighbor?

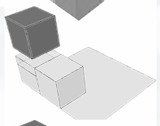

From contextual considerations, most valuable asset of landscape of Bangladesh is the land itself. If we observe the traditional living system of this land from macro level, most spaces are used for cultivation, minimal spaces are used for other livelihood and social activities and shortest portion is used for living purposes. Even in micro level of a vernacular household, largest portion of area is open to sky courtyard. Does it still carries the appeal or can we still think of this luxury for the urban lower income group of people? How can we value this very land?

650 SQFT MODULES

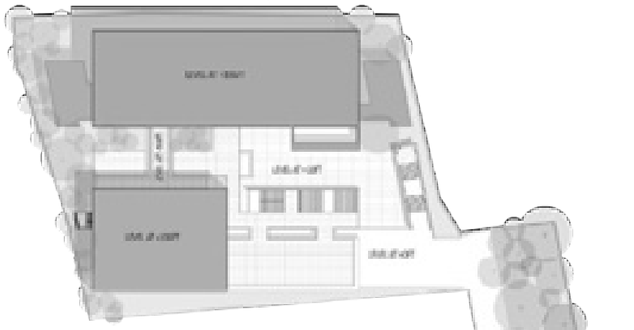

I OWN A DWELL UNIT
I OWN A FOREST TOO

Built forms are placed with proper climatic considerations and with chaos buffer to act as ultimate refuge for inhabitants. Basic row house concept is the housing type here with an articulated corridor working as a social street for circulation and social transitional spaces. This design proposal breaks the conventional concept of 'apartment living' which directly cuts off the families living in housing apart from each other by enclosed staircase and doors which force towards individualistic mindset. Rather circulations are kept open and transparent; visually and spatially connected. From entrance the inhabitant passes through sequence of communal spaces starts from a forest and finally a private room. To minimize the building footprint, programs are arranged inside each unit in multiple layers. The verandas of the bedrooms also face the central common space to strengthen sense of community.

HIGH TECH PARK

EMERGING THE ARCHITYPE OF HIGH TECH PARK CONTEXT & EXPLORING FUDAMENTALS THROUGH PHYSICAL DESIGN

BANGLADESH HI-TECH PARKS

The Bangladesh Hi-Tech Park Authority is hard at work developing the appropriate infrastructure and skilled manpower needed to facilitate a world class business environment for high industrial growth and new business development in the IT sector

28 Hi-Tech Parks(HTP) Software Technology Parks (STP), Hi-Tech Cities and Hi-Tech Villages

8 Privite Software Technology Parks (STPs)

"The government will establish Hi-Tech Parks in every district."

How Rectified Public Accessibility can be integrated along with multiple functionality & to ensure connectivity between commercial workspaces and Accommodation facilities to refurbish the Built environment & design scheme of a Contemporary functional High Tech Park

1 **INCUBATION CENTRES**
To facliliate the Entrepreneurs In the long Terms

2 **ACOMMODATION**
Employee acommodation.

3 **TRAINING CENTRES**
Strenghtening IT infrastructure, and Improved schooling system.

4 **SOFTWARE DEVELOPMENT AREA**
To Develop software Industries

5 **HARDWARE INDUSTRIES**
To Facilate the ICT companies to Expand their business.

ARCHITYPE OF HI TECH PARK

ISSUES

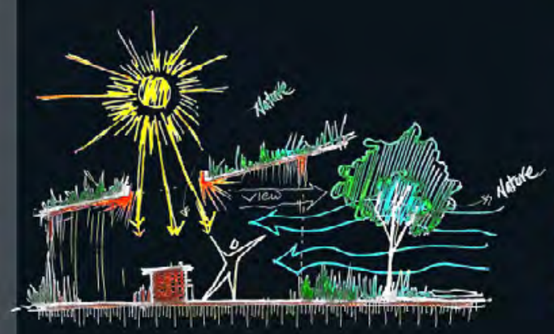

- Public access restriction, Less community involvement
- Disconnection Between Working and Living Area that hampers creativity & innovation
- Conventional Archetype doesn't consolidate the technological growth

OBJECTIVES

- To Create an interactive platform that facilitates learning and sharing
- To integrate the working spaces with livable atmosphere
- To accelerate the Technological growth through an imaginative environment

DESIGN CONSIDERATIONS

- Visibility, Welcoming approach
- Spatial Flexibility, Live-Work-Play
- Open public plaza, Cumulative Journey, Inspirational Walkway

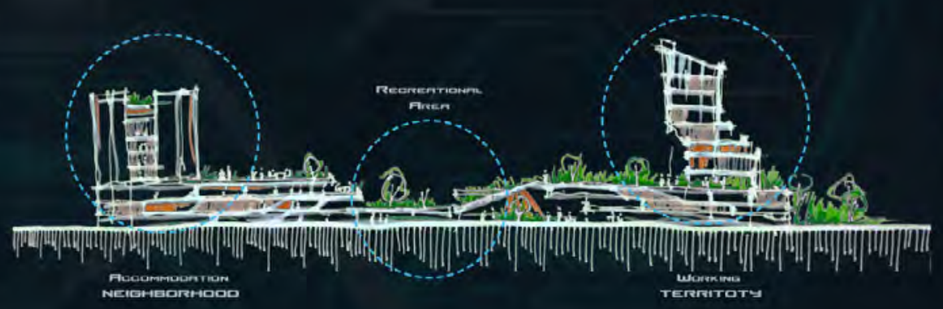

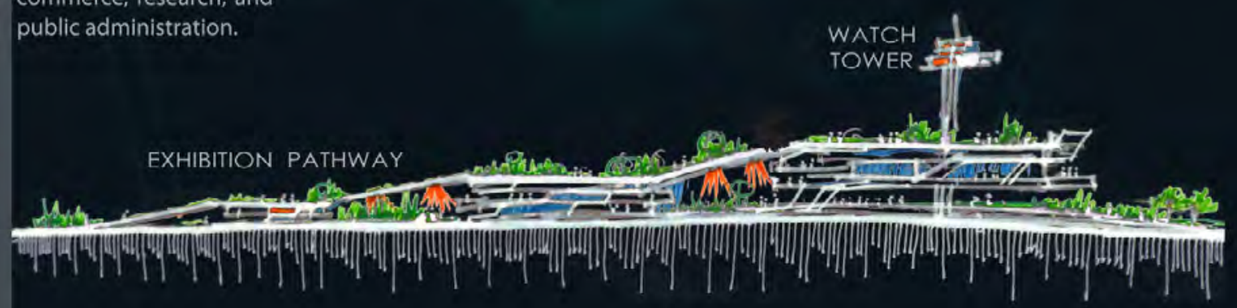

[1990-2000 TILL DATE]
GLOBAL STANDARDS OF HTP PROGRAMS

[2000/2018 TILL DATE]
GLOBAL STANDARDS OF HTP PROGRAMS

The focused area involves research into the production, delivery, and utilization of digital information. The objective is to enhance the competitiveness of the client companies and the renewal of society by introducing new ways of operation to industry, commerce, research, and public administration.

High-Strength Low-Alloy (HSLA) Steel: These alloys offer exceptional strength-to-weight ratios, enabling the construction of taller and more slender structures while reducing material usage.

Lightweight Steel Framing: These systems use less material and energy to produce, reducing the environmental impact of steel buildings.

Pre-engineered Building Systems (PEB): These systems use prefabricated components that are assembled on-site, significantly reducing construction time and costs.

Retreat In Nature

Built form into the nature
Nature into the built form

The idea of the design comes from the age old relationship of nature and human (and their creations.)Here it is tried to make connection between the nature and human. It is wanted to bring the nature into the building as well as bring the building in to the nature.

FORM DEVELOPMENT

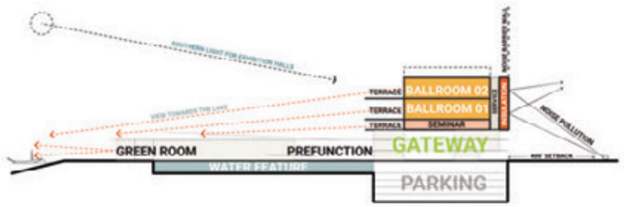

CONCEPTUAL TRANSVERSE SECTION DIAGRAM 01

Architectural Harmony: Uniting Function, Aesthetics, and Authority in Public Spaces

The conceptual diagram illustrates the zoning of programmatic requirements, presenting a layered solution to demonstrate the **seamless public zone** at the ground level. This approach ensures an unobstructed spatial experience for the public, integrating functionality with aesthetic considerations.

Each gallery is designed to capture the Southern light, providing visitors with the added pleasure of a lake view from the **continuous terrace at the South.** To ensure a peaceful ambiance within the Balcony/Exhibition hall, **we've strategically located the service area on the Northern Elevation**, which works as **Noise Barrier.** This not only maintains tranquility but also adds to the bold sculptural presence of the public building. The buildings North and Eastern facade communicates its government authority **while its openness at the base reflects a democratic spirit,** welcoming to all.

CONCEPTUAL LONGITUDINAL SECTION DIAGRAM 02

Harmonious Gateway: Uniting Urbanity and Nature, Enriching Dhaka City

The Gateway, serves as a harmonious link, seamlessly blending the city's urban fabric with the peaceful Southern landscape. **Our design intention was to create an uninterrupted extension of this landscape**, enhancing its natural appeal. This gateway is envisioned as a **focal point for the nearby community of the city.**

STRATEGIES

01_A lofty Gateway

To establish a connection between the urban environment and the river, a loft has been designed to frame the serene landscape from the urban perspective.

02_Naturally ventilated lobby areas

The building is strategically designed to ensure solar gain from the west, and is positioned in the north-south direction to capture air from the south. The entire building is designed with an open terrace and natural ventilation.

03_Dining & Restaurant

The dining area and restaurant are strategically positioned close to the Sky Theatre above.The Auditorium to maximize revenue generation, as the Sky Theatre will be a one of the major public attraction from the proposal.

04_Divisible Ballrooms

The ballrooms are designed to be modular and are situated at the apex of the structure. This placement ensures an unobstructed flow of public movement at the base of the edifice and creates an aesthetically pleasing massing at the pinnacle of the structure.

05_Peripheral service areas

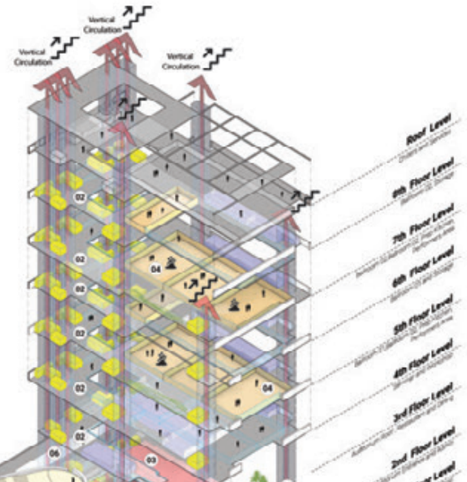

The Power Station, Generator room, and BMS have been strategically positioned at a distance from the main building to mitigate potential hazards. Even the placement of kitchen facilities and other potentially noisy functions has been carefully considered with regard to this concern.

06_Vertical Circulation positioning

The fire stairs and vertical circulation have been placed at the most effective and optimized positions to enhance functional advantages. Similarly, service facilities, close to the core have been meticulously placed with care.

07_Auditorium Intent

The auditorium has been meticulously designed to maximize aperture and coordinate on the vista/ natural forces, thereby enhancing the landscape view.

NOTION

In a rapidly evolving urban landscape like Dhaka, the need for dynamic public spaces has never been more pressing. As architects, we are presented with a unique opportunity to transform a conventional convention center into a vibrant community hub that fosters social interaction, cultural engagement, and urban revitalization. But how do we bridge the gap between functional necessity and social responsibility? How can we ensure that our designs not only meet the demands of today but also contribute positively to the fabric of Dhaka's urban environment? These are the questions that have guided our approach as we embark on this journey of reimagining Dhaka. Through innovative design, thoughtful planning, and a deep understanding of the city's history and context, we believe that we can create more than just a building—we can create a catalyst for positive change. We explore our vision for the convention center of tomorrow—a place where the past meets the future, where community thrives, and where Dhaka's vibrant spirit shines bright.

DESIGNING DHAKA'S DESTINY: COHESION

In our pursuit of excellence for the competition project we have delved deep into the essence of Dhaka's landscape. We are driven by a profound sense of duty, a responsibility to not only meet the demands of today but to shape a brighter tomorrow for Dhaka's citizens. With determination, we've crafted an idea where buildings don't dominate the land, but blend seamlessly with it. We believe Dhaka's public spaces are more than just places to relax—they're vital for freedom and joy.

Our belief is simple yet profound: the building must not stand apart from its surroundings, but rather become one with the landscape it inhabits. This amalgamation of public space into the very fabric of the building is not just an innovation—it is a testament to our commitment to Dhaka's future. As designers, we understand that our creations must evoke emotions, touch the soul, and must leave an indelible mark on the landscape of Dhaka, where every corner of Dhaka resonates with the harmony of community and connection. Let us build not just structures, but legacies that stand as a testament to our unwavering commitment to Dhaka's landscape and its people.

TRI-FRONTAL CONTEMPLATIONS: EXPLORING THREE FACES OF POTENTIAL

The site boasts a stunning river on its southern front and a main road to the north, offering two distinct faces for our project. Through our thorough analysis, we've recognized the gradual blend of the waterline towards the north, presenting an additional front from the southeast. This unique perspective, with its captivating view from the river towards our site, has inspired us to craft a dynamic and engaging corner for the PICC. In essence, our site is privileged with its riverside setting, offering us the opportunity to consider three distinct corners or faces for our project: North, South, and East. Each facet presents its own set of possibilities and challenges, enriching our design approach and ensuring a comprehensive integration with the surrounding environment. This thoughtful consideration of the site's natural features and vistas underscores our commitment to creating a project that not only meets functional needs but also enhances the aesthetic and experiential qualities of its location.

FACTS/DATA

Site area	3,97,517 sft.
Available green area	1,12,000 sft.
Ground Coverage	1,66,250 sft.
Total Built area	15,66,600 sft.
